

CPU MVP

Aperture

A compute workspace
for AI agents

Owner-approved compute for bounded, recoverable runs.

BUDGETED

RESUMABLE

TRACEABLE

When an agent runs, the owner keeps control.

“Turn these CSV files into a report.”

One workflow.
One approved budget.
A result the owner can check.

Owner asks	Aperture guardrail
What can it spend?	One workflow spending cap
Where did it stop?	Resume from the saved journal
What came back?	Verify returned file hashes

Budget. Progress. Verifiable output.

One owner. One agent. Four accountable steps.

The owner approves the plan before execution begins.

Tested on 17,000 rows: all five tasks completed after recovery, with no duplicates.

No task ran twice after the interruption.

A 17,000-row run resumed from the same journal.

17,000

synthetic CSV rows

0

duplicate tasks

**3 output files matched direct Python,
byte for byte.**

Solana records the payment. Aperture returns the files.

Delegated limits keep the agent within an owner-approved scope.

RETAINED DEVNET RUN

3,200

lamports settled on-chain

27 Sep 2026

Protocol layer	What it contributes
Agent passport	Delegated limits + revocation
Payment channel	Task-level settlement
Execution receipt	Input/output hash binding

RPC observation: 5 Oct 2026.

Receipts attest integrity, not correctness of remote computation.

Looking for pilot teams

Bring us a recurring CSV workflow.

AVAILABLE NOW

CPU prototype

MCP tools + Python SDK
Recoverable workflows

NEXT MILESTONE

Pilot validation

Real user workflows
Isolation checks + independent review

Let's test it on a task your team already runs.
